Exercise 6 | Laser Cut Business Cards

What we expect:

- Create a business card design using Inkscape that can be produced with a laser cutter. It should:
 - Use both vector and raster modes.
 - Have dimensions similar to a standard business card (89 x 51 mm). Creative adaptations of the outline or cut-outs are encouraged, but it does not have to be rectangular.
 - Account for bridges when creating cut-out fonts.
 - Align the design to the top left corner of the page in Inkscape, leaving a 1 mm margin from the top and left edges.
- Choose a suitable material (e.g. cardboard, plywood, MDF or acrylic) and produce one business card using the laser cutter in the lab
- Portfolio submission: (1) a photo of your final business card, (2) a description of your design and fabrication process, and (3) pictures of any failed attempts, including a short reflection on what went wrong and how you improved on it.

For inspiration, you can find pictures of example laser cut business cards at: <https://hcie.csail.mit.edu/classes/2021-fall-6810/laser-cut-business-card.html>

Notes: We would like to include pictures of the most stunning business cards in the slides for next year's class. You may opt out. If you do not want to use your real name or email address (for example, for privacy reasons), feel free to use a pseudonym or fantasy name. Using your real name and contact details (e.g. for credit) is, of course, equally acceptable.
